

Experiment 8

Aim: To implement Restoring division algorithm using c-programming.

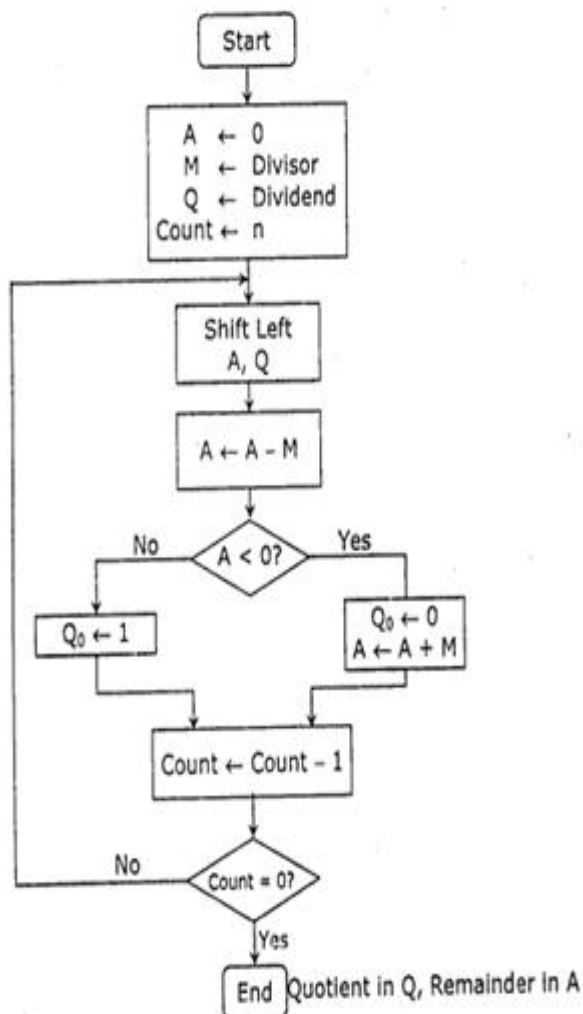

Objective -

1. To understand the working of Restoring division algorithm.
2. To understand how to implement Restoring division algorithm using c-programming.

Theory:

- 1) The divisor is placed in M register, the dividend placed in Q register.
- 2) At every step, the A and Q registers together are shifted to the left by 1-bit
- 3) M is subtracted from A to determine whether A divides the partial remainder. If it does, then Q₀ set to 1-bit. Otherwise, Q₀ gets a 0 bit and M must be added back to A to restore the previous value.
- 4) The count is then decremented and the process continues for n steps. At the end, the quotient is in the Q register and the remainder is in the A register.

Flowchart

Perform $8 \div 3$ by restoring division technique.

	A Register	Q Register	
Initially	0 0 0 0 0	1 0 0 0	
Shift	0 0 0 0 1	0 0 0 □	
Subtract M	1 1 1 0 1		
Set Q ₀	① 1 1 1 0		First Cycle
Restore(A+M)	0 0 0 1 1		
	0 0 0 0 1	0 0 0 0	
Shift	0 0 0 1 0	0 0 0 □	
Subtract M	1 1 1 0 1		
Set Q ₀	① 1 1 1 1		Second Cycle
Restore(A+M)	0 0 0 1 1		
	0 0 0 1 0	0 0 0 0	
Shift	0 0 1 0 0	0 0 0 □	
Subtract M	1 1 1 0 1		
Set Q ₀	① 0 0 0 1		Third Cycle
Shift	0 0 0 1 0	0 0 0 1	
Subtract M	1 1 1 0 1		
Set Q ₀	① 1 1 1 1		Fourth Cycle
Restore(A+M)	0 0 0 1 1		
	0 0 0 1 0	0 0 0 1	
			Remainder Quotient

Program-

```
#include<stdlib.h>
#include<stdio.h>
int acum[100]={0}      ;
void add(int acum[],int b[],int n);
int q[100],b[100];
int main()
{
    int x,y;
    printf("Enter the Number :");
    scanf("%d%d",&x,&y);
    int i=0;
    while(x>0 | y>0)
    {
        if(x>0)
        {
            q[i]=x%2;
            x=x/2;
        }
        else
        {
            q[i]=0;
        }
        if(y>0)
        {
            b[i]=y%2;
            y=y/2;
        }
        else
        {
            b[i]=0;
        }
        i++;
    }

    int n=i;
    int bc[50];
    printf("\n");
    for(i=0;i<n;i++)
    {
        if(b[i]==0)
        {
            bc[i]=1;
        }
        else
        {
            bc[i]=0;
        }
    }
    bc[n]=1;
    for(i=0;i<=n;i++)
```

```

{
if(bc[i]==0)
{
bc[i]=1;
i=n+2;
}
else
{
bc[i]=0;
}
}
int l;
b[n]=0;
int k=n;
int n1=n+n-1;
int j,mi=n-1;
for(i=n;i!=0;i--)
{
for(j=n;j>0;j--)
{
acum[j]=acum[j-1];

}
acum[0]=q[n-1];
for(j=n-1;j>0;j--)
{
q[j]=q[j-1];
}

add(acum,bc,n+1);
if(acum[n]==1)
{
q[0]=0;
add(acum,b,n+1);
}
else
{
q[0]=1;
}
}
printf("\nQuoient : ");

for( l=n-1;l>=0;l--)
{
printf("%d",q[l]);

}
printf("\nRemainder : ");
for( l=n;l>=0;l--)
{
printf("%d",acum[l]);

```

```

}
return 0;
}
void add(int acum[],int bo[],int n)
{
int i=0,temp=0,sum=0;
for(i=0;i<n;i++)
{
sum=0;
sum=acum[i]+bo[i]+temp;
if(sum==0)
{
acum[i]=0;
temp=0;
}
else if (sum==2)
{
acum[i]=0;
temp=1;
}
else if(sum==1)
{
acum[i]=1;
temp=0;
}
else if(sum==3)
{
acum[i]=1;
temp=1;
}
}
}
}

```

Output –

Input:

15 7

Output:

Enter the Number :

Quoient: 0010

Remainder: 00001

Conclusion –

In this experiment, we learned about the division algorithm in computer architecture which is the Restoring Algorithm. In wrapping up the study of restoring division algorithms, it's clear that we've traversed a landscape of precision and efficiency in numerical computation. Restoring division algorithms offer a powerful method for dividing numbers,
